

Hey George, see you tomorrow at 1pm? Here something you may find useful: <https://examples.dask.org/machine-learning/hyperparam-opt.html>

One interesting thing to think about when reading this would be: how this differ when applied to EnTK and its task-based model (instead of process/method-based model as with Dask)?

16 batches }

16 parallel (batches) :

- 1 stage → 8 Tasks : concurrently using all cores
- 8 stages → 1 Task : guarantee of sequentiality using 1 core only
-
-

Two project ? or VM

run on VM : max chance of soft connection not fail (Tunnel)

Two project → RADICAL pays for two physical machines already near Germany

↓ They don't cost us.

↓ access the same through ssh on my machine

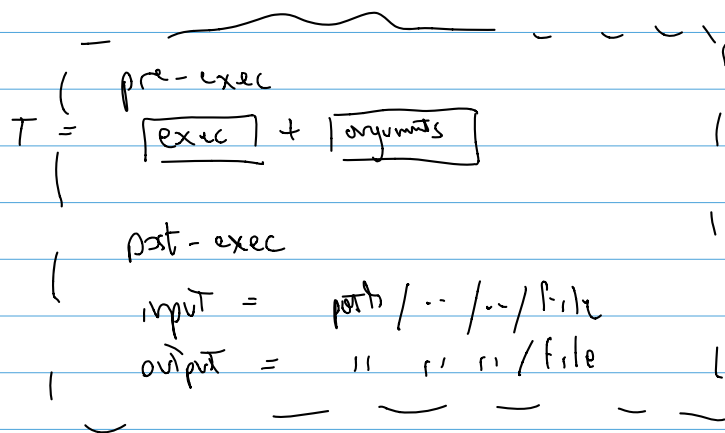

↓ anything preinstalled (rabbitmq, MongoDB, Docker, GSIS14)

HPO

ENTK = TASK

RP = CV

CPU vs GPU

↓
general

↓
specialized → more efficient, faster

everything on CPU $\xrightarrow{\text{can move}}$ on GPU

but no the way around

distributed vs parallel ?

image :

pixels :
(processes)

↑
threads

main diff : independence

distributed is independent

parallel is dependent on data communication

Useful resources for distributed/parallel :
